

Program List

1. Write an ALP to perform 16-bit addition, take the operands from memory, and store the result in consecutive locations of the data/extra segment of memory. Also, justify the status of affected flags.
2. Write an ALP to perform 16-bit subtraction, take the operands from memory, and store the result in consecutive locations of the data/extra segment of memory. Also, justify the status of affected flags.
3. Write an ALP to perform 32-bit addition, take the operands from memory, and store the result in consecutive locations of the data/extra segment of memory. Also, justify the status of affected flags.
4. Write an ALP to perform 32-bit subtraction, take the operands from memory, and store the result in consecutive locations of the data/extra segment of memory. Also, justify the status of affected flags.
5. Write an ALP to copy the N-sized byte/word array from the data segment to the extra segment of memory.
6. Write an ALP to swap the N-sized byte/word array from one segment to another segment of memory.
7. Write an ALP to PUSH (from data segment) and POP your name (to extra segment) in 8086.
8. Write an ALP to find the maximum/minimum number in the given array of byte/word type available at data and extra segment of memory.
9. Write an ALP to sort an array of byte/word type in ascending/ descending order using Bubble Sort. Consider an array availability in data/extra segments.
10. Write an ALP to print (display on the emulator screen) the string of your FULL NAME available at data/extra segment of memory.
11. Write an ALP to print (display on the emulator screen) the string in the reverse order of your FULL NAME available at data/extra segment of memory.
12. Write an ALP to find EVEN and ODD numbers in the given array of byte/word type and display the status on the screen.

13. Write an ALP to find POSITIVE and NEGATIVE numbers in the given array of byte/word type and display the status on the screen.
14. Write an ALP to generate Fibonacci series as word type of array available at data/extra segment of memory.
15. Write an ALP to generate the square series of 10 consecutive numbers (word type) available at data/extra segment of memory.
16. Write an ALP to calculate factorial of a number stored at given memory location.
17. Write an ALP to search a given number (byte/word type) from the given array of byte/word type in data/extra segment. Also, display the status found/not found on the screen.
18. Write an ALP to multiply two operands (byte/word type). Fetch both operands from different segment of memory and also store the result to the memory.
19. Write an ALP to divide two operands (byte/word type). Fetch both operands from different segments of memory and also store the result to the memory.
20. Write an ALP to perform all logical operations (AND, OR, XOR, NOT) in 8086. Fetch the operands from memory.
